A. Heinecke, W. Eckhardt, M. Horsch, H.-J. Bungartz

Supercomputing for Molecular Dynamics Simulations

Handling Multi-Trillion Particles in Nanofluidics

Series: SpringerBriefs in Computer Science

- ▶ Describes the state-of-the-art algorithms and implementations essential for molecular simulation in chemical engineering
- ▶ Includes high-performance implementations of MD algorithms on current HPC systems covering shared-memory, distributed-memory parallelization and vectorization
- ▶ Presents a special focus on hybrid systems using Intel Xeon processors and Intel Xeon Phi coprocessors

This work presents modern implementations of relevant molecular dynamics algorithms using `ls1 mardyn`, a simulation program for engineering applications. The text focuses strictly on HPC-related aspects, covering implementation on HPC architectures, taking Intel Xeon and Intel Xeon Phi clusters as representatives of current platforms. The work describes distributed and shared-memory parallelization on these platforms, including load balancing, with a particular focus on the efficient implementation of the compute kernels. The text also discusses the software-architecture of the resulting code.
